A - Odd Position Sum

Time Limit: 2 sec / Memory Limit: 1024 MiB

 $\mathsf{Score}: 100 \, \mathsf{points}$

Problem Statement

You are given a sequence of positive integers of length N: $A=(A_1,A_2,\ldots,A_N)$.

Find the sum of the odd-indexed elements of A. That is, find $A_1+A_3+A_5+\cdots+A_m$, where m is the largest odd number not exceeding N.

Constraints

- 1 < N < 100
- $1 \le A_i \le 100$
- All input values are integers.

Input

The input is given from Standard Input in the following format:

Output

Print the answer.

14

The sum of the odd-indexed elements of A is $A_1+A_3+A_5+A_7=3+4+5+2=14$.

Sample Input 2

1 100

Sample Output 2

100

Sample Input 3

Sample Output 3

403

B - Four Hidden

Time Limit: 2 sec / Memory Limit: 1024 MiB

Score: 250 points

Problem Statement

You are given a string T consisting of lowercase English letters and ?, and a string U consisting of lowercase English letters.

The string T is obtained by taking some lowercase-only string S and replacing exactly four of its characters with ?.

Determine whether it is possible that the original string S contained U as a contiguous substring.

Constraints

- T is a string of length between 4 and 10, inclusive, consisting of lowercase letters and ?.
- T contains exactly four occurrences of ?.
- U is a string of length between 1 and |T|, inclusive, consisting of lowercase letters.

Input

The input is given from Standard Input in the following format:

T

U

Output

Print Yes if it is possible that the original string S contained U as a contiguous substring; otherwise, print No.

Sample Input 1

tak??a?h? nashi

Yes

For example, if S is takanashi, it contains nashi as a contiguous substring.

Sample Input 2

??e??e snuke

Sample Output 2

No

No matter what characters replace the ?s in T,S cannot contain snuke as a contiguous substring.

Sample Input 3

???? aoki

Sample Output 3

Yes

C - 403 Forbidden

Time Limit: 2 sec / Memory Limit: 1024 MiB

Score: 300 points

Problem Statement

There are N users on WAtCoder, numbered from 1 to N, and M contest pages, numbered from 1 to M. Initially, no user has view permission for any contest page.

You are given Q queries to process in order. Each query is of one of the following three types:

- 1 \times Y: Grant user X view permission for contest page Y.
- 2 X: Grant user X view permission for all contest pages.
- 3 X Y: Answer whether user X can view contest page Y.

It is possible for a user to be granted permission for the same contest page multiple times.

Constraints

- $1 < N < 2 \times 10^5$
- $1 \le M \le 2 \times 10^5$
- $1 \le Q \le 2 \times 10^5$
- $1 \le X \le N$
- $1 \le Y \le M$
- All input values are integers.

Input

The input is given from Standard Input in the following format:

```
\begin{array}{ccc} N & M & Q \\ \mathrm{query}_1 & & & \\ \mathrm{query}_2 & & & \\ \vdots & & & \\ \mathrm{query}_Q & & & & \end{array}
```

Each $query_i$ is in one of the following formats:

```
\begin{bmatrix} 1 & X & Y \\ 2 & X \\ 3 & X & Y \end{bmatrix}
```

Output

For each query of the third type, print Y_{es} if user X can view contest page Y, otherwise print Y_{es} own line.

```
2 3 5
1 1 2
3 1 1
3 1 2
2 2
3 2 3
```

No		
No Yes Yes		
Yes		

- In the first query, user 1 is granted permission to view contest page 2.
- At the second query, user 1 can view only page 2; they cannot view page 1, so print No.
- At the third query, user 1 can view page 2, so print Yes.
- ullet In the fourth query, user 2 is granted permission to view all pages.
- At the fifth query, user 2 can view pages 1, 2, 3; they can view page 3, so print Yes.

Sample Input 2

```
5 5 10
2 2
3 4 4
1 1 1
1 4 1
1 4 2
1 4 4
1 2 4
3 3 2
3 5 4
3 2 1
```

Sample Output 2

D - Forbidden Difference

Time Limit: 2 sec / Memory Limit: 1024 MiB

 $\mathsf{Score} : 425 \, \mathsf{points}$

Problem Statement

You are given a length-N integer sequence $A=(A_1,A_2,\ldots,A_N)$ and a non-negative integer D. We wish to delete as few elements as possible from A to obtain a sequence B that satisfies the following condition:

• $|B_i - B_j| \neq D$ for all $i, j \ (1 \leq i < j \leq |B|)$.

Find the minimum number of deletions required.

Constraints

- $1 < N < 2 \times 10^5$
- $0 < D < 10^6$
- $0 \le A_i \le 10^6$
- All input values are integers.

Input

The input is given from Standard Input in the following format:

$$\begin{array}{cccc}
N & D \\
A_1 & A_2 & \dots & A_N
\end{array}$$

Output

Print the answer.

Sample Input 1

5 2 3 1 4 1 5

1

Deleting $A_1=3$ yields B=(1,4,1,5) , which satisfies $|B_i-B_j|
eq 2$ for all i < j .

Sample Input 2

4 3 1 6 1 8

Sample Output 2

0

The sequence A may already satisfy the condition.

Sample Input 3

10 3 1 6 2 10 2 3 2 10 6 4

Sample Output 3

2

E - Forbidden Prefix

Time Limit: 2 sec / Memory Limit: 1024 MiB

 $\mathsf{Score} : 500 \, \mathsf{points}$

Problem Statement

There are two multisets of strings, X and Y, both initially empty.

You are given Q queries to process in order. In the i-th query, you receive an integer T_i and a string S_i . If $T_i=1$, insert S_i into X; if $T_i=2$, insert S_i into Y.

After processing each query, print this value:

• the number of strings in Y that have no element of X as a prefix.

Constraints

- ullet Q is an integer between 1 and $2 imes 10^5$, inclusive.
- $T_i \in \{1, 2\}$
- ullet Each S_i is a string of length between 1 and $5 imes 10^5$, inclusive, consisting of lowercase English letters.
- $\sum_{i=1}^{\infty} |S_i| \leq 5 imes 10^5$

Input

The input is given from Standard Input in the following format:

 $egin{array}{c} Q \ T_1 & S_1 \ T_2 & S_2 \ dots \ T_Q & S_Q \end{array}$

Output

Print Q lines. The i-th line $(1 \le i \le Q)$ should contain the count after processing the i-th query.

Sample Input 1

```
1 at
2 watcoder
2 atcoder
1 wa
```

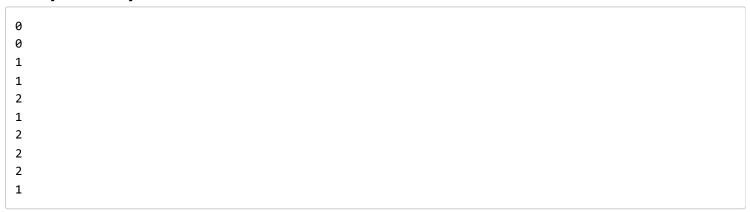

Sample Output 1

```
0
1
1
0
```

The counts after processing the queries for i=1,2,3,4 are as follows.

- i = 1: Y is empty, so the count is 0.
- i=2: watcoder has no element of X as a prefix, so the count is 1.
- i=3: watcoder has no element of X as a prefix, while atcoder has at as a prefix, so the count is 1.
- i=4: watcoder has wa as a prefix, and atcoder has at as a prefix, so the count is 0.

```
10
1 w
1 avko
2 atcoder
1 bzginn
2 beginner
1 atco
2 contest
1 ntxcdg
1 atc
1 contest
```

F - Shortest One Formula

Time Limit: 2 sec / Memory Limit: 1024 MiB

Score: 500 points

Problem Statement

You are given a positive integer N.

Among all valid arithmetic expressions consisting of the characters 1, +, *, (, and), find one of the minimum length whose value is N.

More formally, among the strings S satisfying all of the following conditions, find one of the minimum length:

- S conforms to the symbol <expr> in the BNF
 (https://en.wikipedia.org/wiki/Backus%E2%80%93Naur_form) below.
- The value of the expression represented by S is N.

```
<expr> ::= <term> | <expr> "+" <term>
<term> ::= <factor> | <term> "*" <factor>
<factor> ::= <number> | "(" <expr> ")"
<number> ::= "1" | "1" <number>
```

Strings that conform to <expr> include:

- 1111+111 representing 1111 + 111.
- (1+1)*(1+1) representing $(1+1) \times (1+1)$.
- (11+(1+1)*(1+1))+1 representing $(11+(1+1)\times(1+1))+1$.

Strings that do not conform to <expr> include:

- (1+1)(1+1)
- 1+2
- 1-1
- 1/1
-)1(
- 1++1
- +1
- (+1)
- 1*+1

Constraints

- $1 \le N \le 2000$
- All input values are integers.

Input

The input is given from Standard Input in the following format:

N

Output

Print a solution.

Sample Input 1

9

Sample Output 1

(1+1+1)*(1+1+1)

Expressions whose value is 9 include:

- (1+1+1)*(1+1+1)
- 1+1+1+1+1+1+1+1
- (1+1)*(1+1)*(1+1)+1

Among them, a shortest is (1+1+1)*(1+1+1).

Sample Input 2

11

Sample Output 2

11

Sample Input 3

403

Sample Output 3

1+(1+1+1)*(1+11+11+111)

G - Odd Position Sum Query

Time Limit: 4 sec / Memory Limit: 1024 MiB

 $\mathsf{Score}: 600 \, \mathsf{points}$

Problem Statement

There is an initially empty sequence A.

You are given Q queries to process in order. The i-th query is explained below:

You are given an integer y_i . If i=1, let z be 0; otherwise, let z be the answer to the (i-1)-th query.

Define $x_i = ((y_i + z) \bmod 10^9) + 1$. Append x_i to the end of A.

Then, let $B=(B_1,B_2,\ldots,B_i)$ be the sequence A sorted in ascending order, and find the sum of the odd-indexed elements of B. That is, find $B_1+B_3+B_5+\cdots+B_m$, where m is the largest odd number not exceeding i.

Constraints

- $1 \le Q \le 3 \times 10^5$
- $0 \le y_i < 10^9$
- $1 \le x_i \le 10^9$
- All input values are integers.

Input

The input is given from Standard Input in the following format:

 $egin{array}{c} Q \ y_1 \ y_2 \end{array}$

 $egin{array}{c} arphi_Q \end{array}$

Output

Print Q lines. The i-th line should contain the answer to the i-th query.

Sample Input 1

```
5
1
3
1
99999994
99999993
```

Sample Output 1

```
2
2
8
6
1000000006
```

- For the 1st query, $y_1 = 1$, z = 0, so $x_1 = ((1+0) \mod 10^9) + 1 = 2$. Appending this to the end of A gives A = (2). Sorting A in ascending order yields B = (2), and the sought value is $B_1 = 2$.
- For the 2nd query, $y_2=3, z=2$, so $x_2=((3+2) \bmod 10^9)+1=6$. Appending gives A=(2,6), so B=(2,6) and the sought value is $B_1=2$.
- For the 3rd query, $y_3=1, z=2$, so $x_3=((1+2) \bmod 10^9)+1=4$. Appending gives A=(2,6,4), so B=(2,4,6) and the sought value is $B_1+B_3=8$.
- For the 4th query, $y_4=999999994$, z=8, so $x_4=((999999994+8) \mod 10^9)+1=3$. Appending gives A=(2,6,4,3), so B=(2,3,4,6) and the sought value is $B_1+B_3=6$.
- For the 5th query, $y_5=999999993$, z=6, so $x_5=((999999993+6) \bmod 10^9)+1=1000000000$. Appending gives A=(2,6,4,3,1000000000), so B=(2,3,4,6,1000000000) and the sought value is $B_1+B_3+B_5=1000000006$.
